This document is intended to assist you in wiring in the improved 120/24 Vac 60va transformer used in the Lucks R series ovens model years 1997 to 2000 (Has a door computer but does not have the M series I/O board).

This transformer is critical to the operation of the oven's computer and the oven will not operate if the fusible link inside of it has blown due to power shorts or overload. A 120/24 standard transformer WILL NOT work in its place (except in backup mode).

The BTP new transformer is somewhat larger and may not fit where the OEM model was, use the longer wires supplied and relocate the new transformer where convenient.
